

How to Sync Time-related Information between ServiceNow and Jira

Table of contents

1. Question

2. Answer

- 2.1. Overview
- 2.2. The details
- 2.3. Getting access

This question has been raised on [ServiceNow community](#)

This page details the answer to this question.

1. Question

We have the following workflow:

- An incident is raised on ServiceNow.
- This incident escalates towards Jira where an Epic is created.
- The Epic is broken down into stories. Every story has a time estimate and the actual time spent information.

The question is:

Is it possible to synchronize this time-related information back to the incident, so that we can keep track of the budget consumed by the development activities?

2. Answer

2.1. Overview

This use case is an advanced synchronization case and needs quite some explanation. The overall flow is as follows:

- The incident is escalated to Jira using an Exalate Trigger.
- The Exalate on Jira creates an epic.

- This epic is broken down into stories.
- Whenever a story is created and/ or modified, sync is triggered on the parent epic.
- During the sync from the Epic to the incident, the time tracking-related information is tallied and included in the message to the incident.
- This information is included in custom fields on the incident.

2.2. The details

2.2.1. The incident is escalated to Jira

In Exalate for ServiceNow, you can define a trigger - which will regularly check (every 20 secs) if an incident should be synchronized.

In this case, an additional state has been added, such that the user has an easy way to send over the incident.

The incident gets wrapped into a message, and the message is sent over to Jira.

2.2.2. The Exalate on Jira creates an epic

The Exalate for Jira Server receives the message, finds out if this is the first time this incident is being synced, and processes the following code:

```
Incoming sync
1 - if(firstSync){
2   // If it's the first sync for an issue (local issue does not exist yet)
3   // Set project key from source issue to HAS (the target project)
4   issue.projectKey = "HAS"
5   // Set type name from source issue
6   issue.typeName = "Epic"
7
8   // set the mandatory field 'Epic Name' to some value - now just the title of the incident
9   issue.customFields."Epic Name".value = replica.summary
10 }
11
12
```

This will

- Create the epic.
- fill in the epic name custom field (which happens to be mandatory for Epics).
- Create a synchronization relationship between the incident and the epic.

A link is also added to the incident.

The screenshot shows the ServiceNow interface for an incident (INC0010025). The incident details include: Number (INC0010025), Caller (Francis Martens), Short description (Demo GFI - Take 1), Urgency (3 - Low), and State (Exalate). Below the incident details, there is a 'Jira Issue' section with the following fields: Exalate URL (https://francis-blue.exalate.net/browse/HAS-48), Remote Issue Status (To Do), Total Original Estimate (12d), Total Remaining Estimate (16d 7h 45m), and Total Time Spent (6h 15m). The Exalate URL field is highlighted in yellow. The interface also shows navigation buttons like 'Update', 'Resolve', and 'Delete'.

2.2.3. This epic is broken down into stories

This is something that the development team does and results in a detailed 'mini-project-plan'.

The screenshot shows a Jira Epic page for 'Hasselt / HAS-48'. The page is divided into several sections:

- Details:** Type: Epic, Priority: High, Labels: None, Epic Name: Demo GFI - Take 1, Status: TO DO (View Workflow), Resolution: Unresolved.
- Description:** Click to add description.
- Attachments:** Drop files to attach, or browse.
- Issues in Epic:** A list of three stories: HAS-49 Story 1, HAS-50 Story 2, and HAS-51 Story 3, all with status 'TO DO' and 'Unassigned'.
- Tempo:** A section for time tracking.
- Activity:** A section for comments and work logs.
- People:** Assignee: Unassigned, Reporter: exalate, Votes: 0, Watchers: 1.
- Dates:** Created: Yesterday, Updated: Yesterday.
- Collaborators:** A section for team members.
- Agile:** View on Board.
- Hipchat discussions:** A section for chat discussions.
- Sync Status:** Connection: epic report INC0010025 - Demo GFI - Take 1, Status: SYNCHRONIZED, Last Sync Date: Yesterday.

Two callout boxes highlight specific features: 'Stories in EPIC' points to the 'Issues in Epic' section, and 'Sync Status Panel' points to the 'Sync Status' section.

2.2.4. Whenever a story is created and/ or modified, sync is triggered on the parent epic

Using a 'script listener', update events on stories which are escalated into the sync of the epic.

Bro... Script Con... Built in scri... Listen... Script Fi... REST Endpo... Script Fragm... Escalation Serv... JQL Functi... Resour... ⚙️

Custom listener

Write your own groovy class as a custom listener.

Note

An optional note, used only for your reference.

Project(s)

Filter on events for these projects. Some events, eg **User** events, are not associated with a project.

Events

Which events to fire on.

```
1 TriggerSync.onEpicOfIssue(event.issue, "epic report")
2
3
4
```

Enter your script here

2.2.5. During the sync from the Epic to the incident, the time tracking related information is tallied and included in the message to the incident

Whenever an epic is synced, all the relevant information is collected from the underlying stories (and optionally subtasks), using the following code

```
18 def ced = new CollectEpicData(issue.key)
19 replica.customKeys.totalTimeSpent = ced.storyTotalTimeSpent
20 replica.customKeys.totalOriginalEstimate = ced.storyTotalOriginalEstimate
21 replica.customKeys.totalEstimate = ced.storyTotalRemainingEstimate
22
```

- Line 18 is calling an externalized script which contains the logic to tally all relevant information.
- Line 19 - Line 21 include this information into the message sent to Exalate for ServiceNow.

2.2.6. This information is included in custom fields on the incident

The code to update the ServiceNow incident is:

```
24 issue.customKeys."u_exalate_url" = "https://francis-blue.exalate.net/browse/" + replica.key
25 issue.customKeys."u_exalate_status" = replica.status.name
26 issue.customKeys."u_total_original_estimate" = prettyPrint(replica.customKeys.totalOriginalEstimate)
27 issue.customKeys."u_total_remaining_estimate" = prettyPrint(replica.customKeys.totalEstimate)
28 issue.customKeys."u_total_time_spent" = prettyPrint(replica.customKeys.totalTimeSpent)
29
```

The `prettyPrint` method is a custom method (included in the script) which transforms the duration into a pretty print format (expressing time in days/hours/minutes).

```
8 def prettyPrint = {
9   duration ->
10    if (!duration) return "NA"
11
12    def days = (duration / 28800).trunc().round()
13    def dayLabel = days > 0 ? days + "d" : ""
14
15    def hours = ((duration - (days * 28800)) / 3600).trunc().round()
16    def hourLabel = hours > 0 ? hours + "h" : ""
17
18    def mins = ((duration - ((days * 28800) + (hours * 3600))) / 60).trunc().round()
19    def minLabel = mins > 0 ? mins + "m" : ""
20
21    return (dayLabel + " " + hourLabel + " " + minLabel ).trim()
22 }
23
```

2.3. Getting access

The whole configuration is available and can be requested through our support channel.
